

Company Overview

LabOnTime aims to transform the landscape of In Vitro Diagnostics (IVD) by leveraging cutting-edge AI and computer vision (CV) technologies. Our platform ensures accurate, convenient, and automatic determination of diagnostic test results, streamlining data management, and enhancing patient care.

The Problem

Self-Testing Challenges:

- Inefficient data recording and management for self-administered IVD tests (e.g., COVID-19 antigen, fecal occult blood, pregnancy).
- Missing information and incomplete patient records.
- Potentially erroneous and delayed medical decisions due to data gaps.

Point-of-Care (POC) Testing Issues:

- Current systems are error-prone and inefficient.
- Manual data entry leads to increased workload and risks to patient safety.
- Difficulties in accessing historical test results.

Our Solution

LabOnTime has developed a CV-based platform for the automatic analysis and secure transmission of IVD test results via mobile devices. Our solution addresses the challenges of self-testing and POC diagnostics by providing a reliable, accurate, and user-friendly interface.

Embedded Architecture

Minimized cloud expenses
Exhibiting a high degree of accuracy and usability.

Zero Data

Personal data safety is assured – no patient data collected.
Lower barrier for regulatory approval.

Webapp Interface

No download, install or sign-up required for our app services.
Easy connection with common platforms used by HMOs and health insurance companies.
Runs on both iPhone & Android

Computer Vision

Reliable & Adaptable to other test formats (cassettes, devices, strips, etc.).
Easy to add different tests to this platform (markers, indications, etc.).

Key Features

- Embedded Architecture: Minimizes cloud expenses and ensures high accuracy and usability.
- Zero Data Collection: Ensures personal data safety with no patient data collected.
- Webapp Interface: No download, install, or sign-up required; seamless integration with common healthcare platforms.
- Multi-Device Compatibility: Runs on both iPhone and Android devices.
- Adaptable CV Technology: Easily integrates various test formats and additional tests.

Market Opportunity

- Serviceable Obtainable Market (SOM): The Israeli market for FOB screening is estimated at 3M tests/year.
- Serviceable Available Market (SAM): Western countries with FOB tests for populations aged 50-75, estimated at 96.8M people in the USA.
- Total Addressable Market (TAM): Includes additional self-tests (e.g., COVID-19, rotavirus, cancer markers), representing a multi-billion euro opportunity.

Traction and Milestones

- CV-Based Algorithm: Developed and successfully tested on multiple mobile devices.
- User-Friendly Application: Available in multiple languages.
- Patent: US patent granted with several continuations submitted.
- Partnerships: Connected to leading Israeli IVD manufacturers with multiple approved self-tests.
- Certification: ISO21007 certified.

Business Model

Business-to-Business-to-Consumer (BTBTC):

- Manufacturer/Producer
- Distributor/Wholesaler

Business-to-Consumer (BTC):

- HMOs
- Health Insurances
- Healthcare Systems

Vision

LabOnTime envisions a future where accurate and user-friendly rapid diagnostic tests (RDTs) shift IVD performance from centralized labs to self-use, reducing lab workload and improving healthcare provision and disease prevention.
